

Excellent Systems

Threshold system

Excellent Systems is a modular threshold system that is very easy to reuse and can be used in any situation.

A sustainable threshold solution for disabled residents.

Excellent Systems offers a complete threshold solution for all conceivable situations to make homes and flats accessible.

Advantages Excellent Systems

- Reusable for 95% (cost = investment)
- Can be fitted in every situation
- Applicable in indoor and outdoor situations
- Soundproofing
- Non-slip
- Clean & Safe
- Easy to clean
- Water disposal
- Sloping sides possible
- Not susceptible to theft

Excellent Systems is a unique threshold system that is easy to tame, disassemble and reuse. The Excellent Systems threshold system consists of separate parts that can be clicked together like a kind of Lego. The material is available in different colours, so that it is also possible to mark a run-up strip for people with restricted vision.

Depending on the situation, three different slope angles can be used (1:6,7 - 1:13,3 - 1:20). By sawing off the slope tiles to size, the threshold is laid against an existing house threshold without **any level difference**. In addition to the standard straight gradients, there are also angular gradients with which a slope can be taken at an angle. This makes it unnecessary to drive perpendicular to a slope, as is often the case with other threshold solutions. This gives wheelchair users extra freedom of movement and is also safer, as users cannot fall off at the sides of the threshold solution.

With Excellent Systems entire galleries and balconies can be adapted.

Complete gallery and balcony elevations

Excellent Systems is the perfect solution for placing large threshold solutions on balconies or galleries. Decking allows you to raise the **entire floor of balconies and galleries**, making it passable for wheelchair users, among others.

Concrete and wooden constructions are often too expensive and heavy to apply. An Excellent Systems decking of 16.2 centimetres high weighs only 25 kilos per square metre. Thanks to the rapid drainage of rainwater, Excellent Systems is excellent for use on balconies, galleries or wet rooms. The water can simply flow under the tiles to the existing drain. Moreover, thanks to the flexible tiles, **the system can withstand large temperature differences** without bulging or damaging the walls.

Balustrade elevation

In addition to floor solutions, it is also possible to raise the balustrade without damaging it. The elevation is fixed with clamps and can be removed easily and without traces. The balustrade riser is made of anodised aluminium and therefore does not rust.

The advantages

Reuseable

A cost-saving investment

After disassembly 95% of the material can immediately be used again in a new solution to be laid. Due to its high wear resistance and colour fastness, it can hardly be distinguished from new after years of use. This makes Excellent Systems an excellent, sustainable investment.

Clean & Safe

Fire retardant and 100% non-toxic

The material is made of 100% toxic and PVC-free plastic and is even approved for use in food and beverages. In addition, Excellent Systems is fire retardant and does not release any toxic substances in the event of a fire.

Soundproofing

Very low noise propagation

In contrast to a metal threshold solution, Excellent Systems produces hardly any noise. This is because the material has a low sound propagation, much lower than wood or metal.

Easy to clean

Everybody can do it

The threshold solution is very easy to clean with everyday detergents. It can be vacuumed and mopped, but is also resistant to professional mopping and polishing machines. A broom is more than enough for daily cleaning.

Water disposal

Rainwater is quickly drained away

The open construction ensures that water can flow unhindered into the existing drainage system. The openings in the material are large enough for rapid drainage of rainwater, yet small enough to keep the surface easy to walk on with stiletto heels.

Non-slip

Under all weather conditions

The roughness of the floors and slopes has been extensively tested and more than meets European standards. In contrast to metal threshold aids, Excellent Systems is also easily passable in winter conditions and even with black ice.
